# Elmar Leonard

Junior Data Analyst

Jakarta, Indonesia | +62 896-6202-7379 | elmarleonard77@gmail.com | https://www.linkedin.com/in/elmar-leonard | https://github.com/ElmarLeonard9 | https://elmarleonard9.github.io/Portfolio/

## SUMMARY

Computer Engineering graduate skilled in SQL, Python, Tableau, and statistical analysis, with a focus on turning raw data into clear business insight. Analyzed about 100,000 Olist orders and confirmed with Welch's t-test that late deliveries cut review scores from about 4.2 to 2.3, and traced a 2.51-day scheduling gap across 300,000 order records to a systemic issue worth an estimated Rp 54.88 billion. Delivers findings as dashboards and clear recommendations. Seeking a Junior Data Analyst role to help teams make better decisions with data.

## SKILLS

**Technical Skills:** SQL (MySQL), Python, pandas, NumPy, Data Cleaning & Wrangling, Exploratory Data Analysis (EDA), Statistical Analysis, Hypothesis Testing (ANOVA, Welch's t-test), Data Visualization (Matplotlib, Seaborn), Dashboard Development, Dashboard Reporting, SciPy, scikit-learn, Machine Learning, Predictive Modeling, Web Scraping, Process Automation

**Tools:** Tableau, Google Data Studio, Microsoft Excel, Streamlit, Git, GitHub, Selenium

**Soft Skills:** Analytical Thinking, Data-Driven Decision Making, Problem Solving, Communication & Presentation, Team Collaboration

**Languages:** Indonesian (Native), English (Full Professional Proficiency)

## PROJECTS

**Olist E-Commerce Late Delivery Analysis & Prediction** Aug 2026 – Sep 2026

**Tech Stack:** Python, pandas, NumPy, scikit-learn, Matplotlib, Seaborn, Tableau, Streamlit

**Links:** GitHub: https://github.com/ElmarLeonard9/Olist_Data-Analysis_and_Late-delivery-Prediction-Modeling | Dashboard: https://public.tableau.com/views/Olist-Dashboard_17882680567370/Overview | Demo: https://olist-late-delivery-predictor.streamlit.app/ | Presentation: https://canva.link/2ngd2juehqeli1c

- **Business Problem**: Olist's average review score (4.01) trailed the 4.5 industry average. Late deliveries (6.7% of delivered orders) cut review scores from about 4.2 on time to about 2.3 when late, hurting customer satisfaction and marketplace revenue.
- **Operational Action**: Analyzed about 100,000 e-commerce orders in a team of three using Python and Tableau, confirmed the late-delivery effect on reviews with Welch's t-test ($p < 0.001$), evaluated 12 data-leakage-free classification models, deployed the late-delivery predictor as a Streamlit app, and presented the findings to mentors in a graded bootcamp assessment.
- **Financial & Performance Results**: The selected model flagged 87% of truly late orders. In a simulation, it raised the estimated average review score from 3.01 to 3.98 (+32.26%) and turned an estimated R$28,900 loss into a R$15,793 net gain, with about half the seller false alarms of notifying every seller.

**Home & Living Company Unsynchronized Delivery to Installation Analysis** Jun 2026

**Tech Stack:** Python, Pandas, NumPy, SciPy, scikit-posthocs, Matplotlib, Seaborn

**Links:** GitHub: https://github.com/ElmarLeonard9/Unsynchronized_Delivery_to_Installation_on_Home_and_Living_Company_Analysis | Presentation: https://canva.link/0jk55tcf9obibwo

- **Business Problem:** In 2023, Home & Living Company faced rising return-logistics costs and falling customer satisfaction: 66.8% of furniture installations breached their 1-day SLA, and 20.42% of assemblies failed due to defective or missing supplier parts.
- **Operational Action:** In a team of two, jointly merged and cleaned 300,000 order records across physical and digital channels using Python (pandas, NumPy), and ran ANOVA and Welch's t-tests to pinpoint scheduling bottlenecks, compare product mix across channels, and isolate supplier failure rates.
- **Financial & Performance Results:** Found a uniform 2.51-day scheduling gap caused by a systemic issue in the scheduling engine, with an estimated Rp 54.88 billion financial exposure concentrated in Wardrobes.

- **Recommendations:** Proposed a single fix in the central scheduling engine (delivery-date-driven assignment with a hard 24-hour SLA), targeted supplier audits for top failure categories, standardized omnichannel attribution, and stricter data-entry validation.

**Bank Marketing Campaign Analysis & Conversion Prediction** Jul 2026

**Tech Stack:** Python, pandas, NumPy, scikit-learn, Matplotlib, Seaborn

**Links:** GitHub: https://github.com/ElmarLeonard9/Bank_Marketing_Campaign_Analysis_-_ML | Presentation: https://canva.link/acge9u68qwp88un

- **Business Problem**: The retail bank's term-deposit telemarketing campaign was inefficient: calling the entire customer list wasted call-center hours on customers who rarely subscribed.
- **Operational Action**: Led the modeling in a team of two: trained and compared 14 classification models in scikit-learn and selected Gradient Boosting, reaching 80% recall and 63% precision at a 0.351 probability cutoff.
- **Financial & Performance Results**: In a simulation with illustrative costs ($15 per call, $300 per deposit), the model-guided call list cut calls by 41% (about $9,555 saved) and converted 36% better than random dialing at the same call volume.

**Finviz Stock Screener Web Scraper & MySQL Database** Jun 2026

**Tech Stack:** Python, SQL (MySQL), Requests, BeautifulSoup, PyMySQL

**Links:** GitHub: https://github.com/ElmarLeonard9/Web_Scraper

- **Business Problem & Action**: Finviz screener data is spread across paginated pages, blocking bulk querying and historical tracking. Built a solo Python pipeline using Requests and BeautifulSoup to crawl pages with randomized delays, plus a PyMySQL class that loads and updates ten fields per stock in a MySQL database.
- **Financial & Performance Results**: Delivered a reusable pipeline that loaded 11,708 company records into a clean, duplicate-free MySQL table, refreshable with a single command.

## WORK EXPERIENCE

**Data Associate (Contract), Ministry of Health of Indonesia, Central Jakarta** Sep 2025 – Feb 2026

**Tech Stack:** Python, Selenium, Microsoft Excel

- Collaborated in a team of three to clean and prepare about 100,000 Adverse Events Following Immunization (AEFI) records using Excel and Python, resolving duplicates, inconsistent formats, and missing values, and restructuring the data for system integration.
- Developed a Python and Selenium automation tool that entered all 100,000 records into the Biofarma website, cutting processing time from 3 minutes to 1 minute per entry (-67%).
- Implemented script-based validation to verify data accuracy across the entered records.

## EDUCATION

**Bachelor of Computer Engineering, Diponegoro University** 2019 – 2026

GPA 3.73/4.00

**Purwadhika Digital Technology School** Apr 2026 – Oct 2026

Job Connector Data Science & Machine Learning (JCDSBSD-33)

## CERTIFICATIONS

**Data Science & Machine Learning, Purwadhika Digital Technology School** Oct 2026

**SQL (Advanced), HackerRank** Oct 2026

**Credential:** https://www.hackerrank.com/certificates/3ca99c11c7a4

**Building Personal Image, Innergy Personality & Communication** May 2026

**Credential:** https://elmarleonard9.github.io/Portfolio/certifications/E-Certificate_Innergy.pdf
